

Flexco HD series' radiant heating panels

For suspended ceilings or surface mount installations. The heating principle is very simple. Just like the sun when heating the earth with it's transfer of radiant energy, without warming the ambient air directly. FLEXCO 'HD Series' - High density - warms people, objects and surfaces without heating the air directly.

The heat transfer is made softly and gradually. The cold surfaces absorb the energy emitted by the warm surfaces and the air is warmed by the contact of these hot surfaces. Since the human body feels this good sensation of warmth, we can reduce the temperature setting of thermostat.

The components that are used to manufacture FLEXCO 'HD Series' heating panels are premium quality products. The coating applied is an high temperature acrylic paint that is baked in an oven. Before shipping, each panel is individually tested for proper operation and a name plate corresponding to watts and voltage is applied. All 'HD Series' panels have a limited warranty of 10 years of good operation.

Availability

The 2' x 2' panels have power ratings from 250 to 350 watts and are available on 120V, 208V and 240 Volts.

The 2' x 4' panels have power ratings from 500 to 750 watts and are available on 120V, 208V, 240V and 347 Volts.

- Limited 10 years good operation warranty
